Kannur, Kerala, India

OBJECTIVE

Backend Engineer with experience shipping features end to end across the stack, building production-grade **Go services** and distributed backend systems. Strong in REST API design, PostgreSQL, concurrency, infrastructure, and product quality, leveraging AI-assisted development tools to build, test, and iterate faster.

EXPERIENCE

- **Trellix (formerly McAfee)** *Bangalore*
  Software Engineer Apprentice Jul 2025 – Jul 2026
  - **Developed** a REST API service in **Go (Golang)** with Gin for a malware submission dashboard using Clean Architecture and CQRS-lite; wrote testable, maintainable code across API, service, and data layers under senior engineers' guidance, and **eliminated N+1 queries** via optimized aggregation queries.
  - **Resolved 16 product defects** across **4 platforms** (Linux, Windows, macOS, Windows Server) through log analysis, issue reproduction, and root-cause debugging across service boundaries.
  - **Improved reliability** with structured error handling, consistent logging, and graceful failure propagation in the Go service; **built automation testing** for malware submission workflows, with cross-browser E2E tests in Python and Playwright.
  - **Collaborated** with senior engineers on architecture, code reviews, design discussions, and cross-functional QA.

PERSONAL PROJECTS

- **GoQueue – Distributed Job Queue Microservice** *Dec 2025 – Feb 2026*
  Go, GORM, PostgreSQL, Docker, GitHub Actions github.com/joshua-sajeev/goqueue
  - **Engineered** a goroutine worker pool with PostgreSQL row-level locking (`FOR UPDATE SKIP LOCKED`), preventing duplicate job processing across concurrent workers, with partition-aware distribution for email, payment, and webhook jobs.
  - **Cut integration test time by** $\sim$**45%** (9.7s $\rightarrow$ $\sim$5s) using Dockerized PostgreSQL and shared `pgxpool` connection pooling.
  - **Built 261+ test cases** at 87.8% cross-package coverage spanning worker lifecycle, context cancellation, retry failures, and concurrency; automated CI/CD with GitHub Actions.
- **Paisa – Personal Finance Tracker API** *Aug 2026 – Present*
  Go, TypeScript, PostgreSQL, chi, pgx/v5, Goose github.com/joshua-sajeev/paisa
  - **Architected** a RESTful Go backend (chi, Handler-Service-Repository) covering **4 domains**: accounts, transactions, goals, and savings; implemented PIN-protected session auth with atomic PostgreSQL transactions for consistency under concurrent operations.
  - **Prompted 4 AI coding tools** (Claude Code, Codex, Gemini CLI, Antigravity) with explicit engineering context (layering, chi, pgx/v5, Goose, atomic-transaction requirements) for code generation, debugging, and test creation; **validated and refined all AI output** through manual review, tests, benchmarks, and load tests for correctness and performance.
  - **Wrote unit, integration, and end-to-end tests**, using AI-assisted test generation to broaden coverage alongside hand-written cases for edge and failure paths across handlers, services, and repositories.
  - **Profiled** PostgreSQL queries on a **10K-transaction dataset** using Go benchmarks and `EXPLAIN (ANALYZE, BUFFERS)`; **load-tested** with Vegeta at 100–1,000 req/s, sustaining **999.91 req/s, 100% success, 5.42 ms P95, 6.39 ms P99**.

EDUCATION

- **APJ Abdul Kalam Technological University** *Vimal Jyothi Engineering College*
  B.Tech in Computer Science – GPA: 8.17/10.0 May 2025

TECHNICAL SKILLS

Languages:	Go (Golang), SQL
Backend:	REST APIs, Microservices, Distributed Systems, Concurrency, Goroutines
Databases:	PostgreSQL, Transactions
Testing & DevOps:	Unit, Integration, E2E Testing, Docker, CI/CD, GitHub Actions
AI Tooling:	Claude Code, Codex, Gemini CLI, Antigravity
Tools:	Gin, chi, Linux, Git
Collaboration:	Agile/Scrum, Code Reviews, Cross-functional Communication
CS Fundamentals:	Data Structures, Algorithms, System Design
